NATURE

Nature is a British weekly scientific journal founded and based in London, England. As a multidisciplinary publication, Nature features peer-reviewed research from a variety of academic disciplines, mainly in science, technology, and the natural sciences. It has core editorial offices across the United States, continental Europe, and Asia under the international scientific publishing company Springer Nature. Nature was one of the world's most cited scientific journals by the Science Edition of the 2019 Journal Citation Reports (with an ascribed impact factor of 42.778),[1] making it one of the world's most-read and most prestigious academic journals.[2][3][4] As of 2012, it claimed an online readership of about three million unique readers per month.[5] Founded in autumn 1869, Nature was first circulated by Norman Lockyer and Alexander Macmillan as a public forum for scientific innovations. The mid-20th century facilitated an editorial expansion for the journal; Nature redoubled its efforts in explanatory and scientific journalism. The late-1980s and early-1990s created a network of editorial offices outside of Britain and established ten new supplementary, specialty publications (e.g. Nature Materials). Since the late 2000s, the weekly created dedicated editorial and current affairs columns, as well as electoral endorsements. The primary source of the journal remain, as established at its founding, research scientists; editing standards are primarily concerned with technical readability. Each issue also features articles that are of general interest to the scientific community, namely business, funding, scientific ethics and research breakthroughs. There are also sections on books, arts, and short science fiction stories.
